APR-06-2005 09:11 FPCD6133 972 917 4418 P.03

IN THE CLAIMS:

1. (Original) A method for forming a localized halo structure in a semiconductor substrate of a semiconductor device, comprising:

providing a gate structure over the semiconductor substrate;

implanting a dopant material at an angle around the gate structure to form a halo structure in a source/drain region of the semiconductor substrate and underlying a portion of the gate structure;

forming a trench in the source/drain region of the semiconductor substrate, thereby removing at least a portion of the halo structure in the source/drain region; and

forming a semiconductor material layer in the trench using epitaxial deposition.

- 2. (Original) The method of claim 1, wherein the semiconductor material layer comprises silicon.
- 3. (Original) The method of claim 1, wherein forming the semiconductor material layer comprises:

forming an intrinsic silicon layer in a bottom portion of the trench; and forming a doped silicon layer in a top portion of the trench overlying the intrinsic silicon layer, wherein the trench is substantially filled having a generally undoped region in a bottom portion of the trench and a generally doped region in a top portion of the trench.

4. (Original) The method of claim 3, further comprising: thermally processing the device;

forming a spacer on lateral sidewalls of the gate structure; and performing a source/drain implant into the semiconductor material layer in the trench to form a source and drain region.

- 5. (Original) The method of claim 4, wherein the trench has a depth, and wherein the source and drain region have a depth which is less than the trench depth.
- 6. (Original) The method of claim 4, wherein thermally processing the device comprises rapid thermal annealing to slightly grade a junction formed between the undoped silicon material layer and the doped silicon material layer in the trench.
- 7. (Original) The method of claim 1, wherein the forming the semiconductor material layer in the trench using the epitaxial deposition comprises filling substantially the entire trench with silicon or SiGe.
- 8. (Original) The method of claim 7, further comprising: implanting an HDD dopant into a top portion of the silicon or SiGe in the trench.
- 9. (Original) The method of claim 8, further comprising: thermally processing the device; forming a spacer on lateral sidewalls of the gate structure; and performing a source/drain implant into the silicon material layer to form a source and drain region having a depth that is less than a depth of the trench.

APR-06-2005 09:11 FPCD6133 972 917 4418 P.05

10. (Original) The method of claim 1, wherein forming the trench comprises etching the semiconductor substrate in the source/drain region in a substantially anisotropic manner.

- 11. (Original) The method of claim 1, further comprising cleaning the device after the formation of the trench.
- 12. (Original) The method of claim 3, wherein a thickness of the intrinsic silicon layer is greater than a thickness of the doped silicon layer.
- 13. (Original) The method of claim 3, wherein the doped silicon material layer comprises one of Si doped with As, SiGe doped with As, Si doped with B and SiGe doped with and B.

14-16. (Cancelled)
